

Hello Everyone

My Project Name : Box Shooter Game

Course Code : CSE178

Project Supervisor:

MD Nesarul Hoque

Assistant Professor

Department of CSE,BSMRSTU

Gopalganj-8100.

Submitted By:

Tushar Sarkar

Student ID: 18CSE035

Department of CSE,BSMRSTU

Presentation Outline

- ▶ Introduction
- ▶ The process to play the Box Shooter game
- ▶ Features
- ▶ Some Snapshots
- ▶ Results & Evaluations
- ▶ Future Plan
- ▶ Conclusion

Introduction

- ❑ A box shooter is a game which can also be called a mind sport where in the players , either as individuals or in teams attempt to answer question.
- ❑ A box shooter is an entertainment in which the general or specific knowledge of the players is tested by a series of questions as like as radio or television program or mobile & pc game.

The process to play the Box Shooter Game

- ❖ You will first be given a frame in the shape of a quadrangle with 50 boxes at the top and a stage and a ball at the bottom.
- ❖ Now clicking on space will start the game, clicking on the left key of the special keyboard will move 10 space to the left and will continue to move 90 degrees and hit the box. If you can eat one box, it will be 5 marks.
- ❖ The game will end when the ball goes off the stage.
- ❖ If you can finish the whole game you will be successful and you will be congratulated.

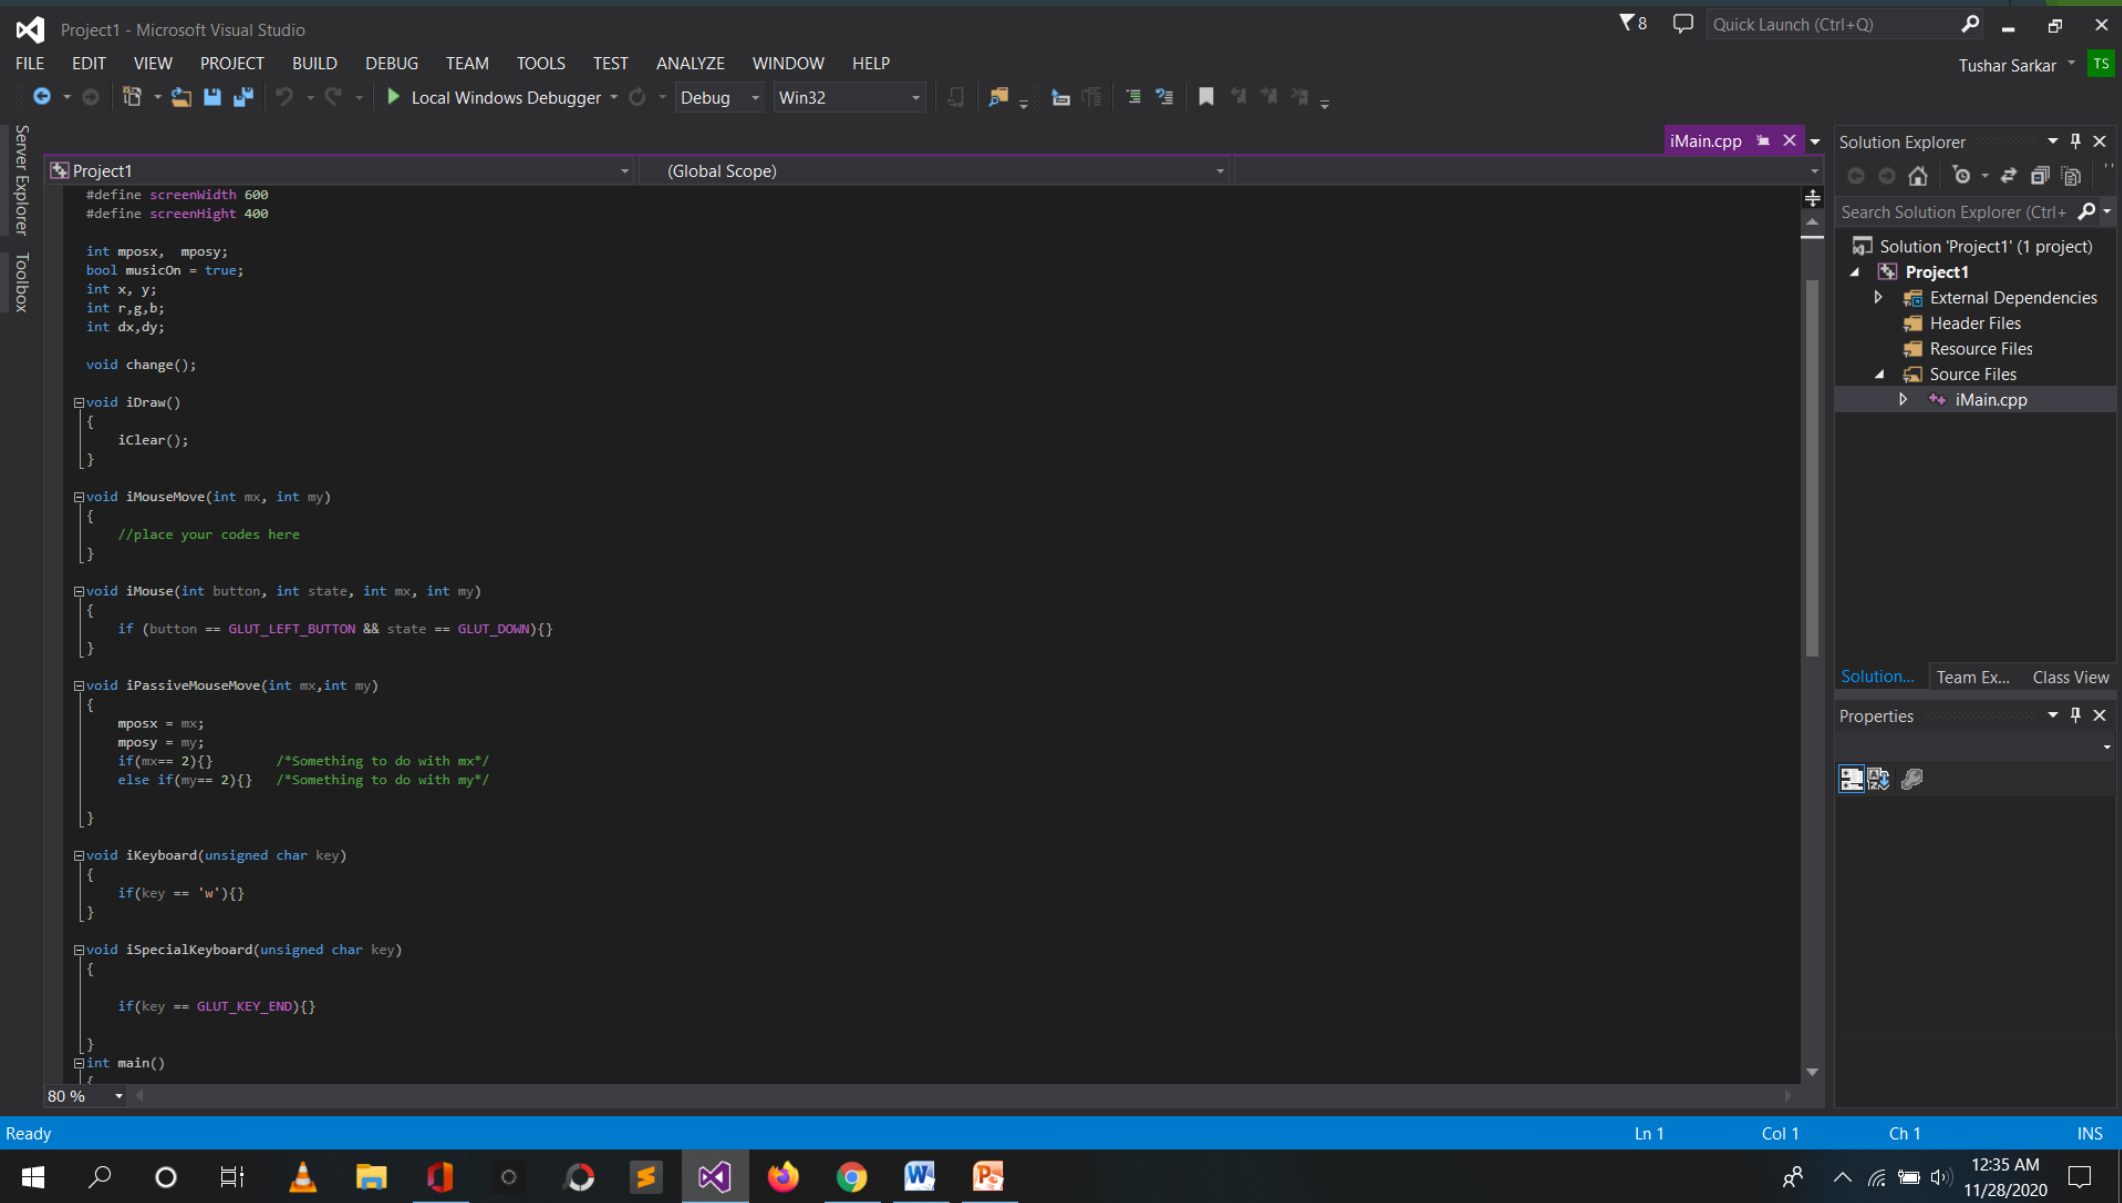

Features

- The frame for this game will be $1200 * 675$ in size.
- The 50 boxes at the top will each be $100 * 20$ in size.
- The stage below will be $200 * 10$ in size.
- The radius of the ball on the stage will be 10.
- The song will play in the background as soon as the game starts. Songs can be started and stopped at will.
- There are 5 pictures set in the background of the frame, you can change the picture as you wish.
- If you play, you will be notified of the current score and signal and if you finish the game, you will be congratulated and the signal will be there.

Some Snapshots

- ❖ iGraphics Function
- ❖ Main Function
- ❖ First Look of Program
- ❖ First Look when Program Run
- ❖ While the game is going on
- ❖ While the game is loss
- ❖ When all the boxes have been eaten and success

iGraphics File

Graphics function work

```
void iDraw(){
    iClear();
    // function iDraw() is called again and again by the system & drawing codes here
}

void iMouseMove(int mx, int my){
    //function iMouseMove() is called when the user presses and drags the mouse.(mx, my) is the
    Position where the mouse pointer is.
}

void iPassiveMouseMove(int mx,int my){
    //iPassiveMouseMove is called to detect and use the mouse point without pressing any button
}

void iKeyboard(unsigned char key){
    //function iKeyboard() is called whenever the user hits a key in keyboard.key- holds the ASCII
    or special keyboard value of the key pressed.
}
```

Main Function & Work

```
int main()
{
    //place your own initialization codes here.
    initialize(x,y, "demooo");
    return 0;
}
```

- ❖ The **main () function** as a built-in **function**.
- ❖ The compilers of most of the programming languages are so designed that the **main () function** constitutes the entry point of the program execution.
- ❖ The **main () function** provides a platform for calling the first user-defined **function** in the program.

First Look of Program

The screenshot displays the Microsoft Visual Studio IDE with a project named 'Test1'. The main editor window shows the file 'iMain.cpp' with the following code:

```
/*
Project Name: BOX SHOOTER
Author      : Tushar Sarkar
Institute   : Bangabandhu Sheikh Mujibur Rahman Science and Technology University, Gopalgong.
Department  : Computer Science and Engineering
Student ID   : 18CSE035
Start Date  : November 15, 2020
End Date    : November 25, 2020
Language    : C/C++
Platform    : Visual Studio Community 2013
Version     : 2.0
*/

// Write to main project code_____

#include<iostream>
using namespace std;
#include "iGraphics.h"

#define totalBricks 5*10
#define screenWidth 1200
#define screenHeight 675
#define yAxisMargin 50

struct brickStructure
{
    int x;
    int y;
    int dx = 100;
    int dy = 20;
    int red;
    int green;
    int blue;
}
```

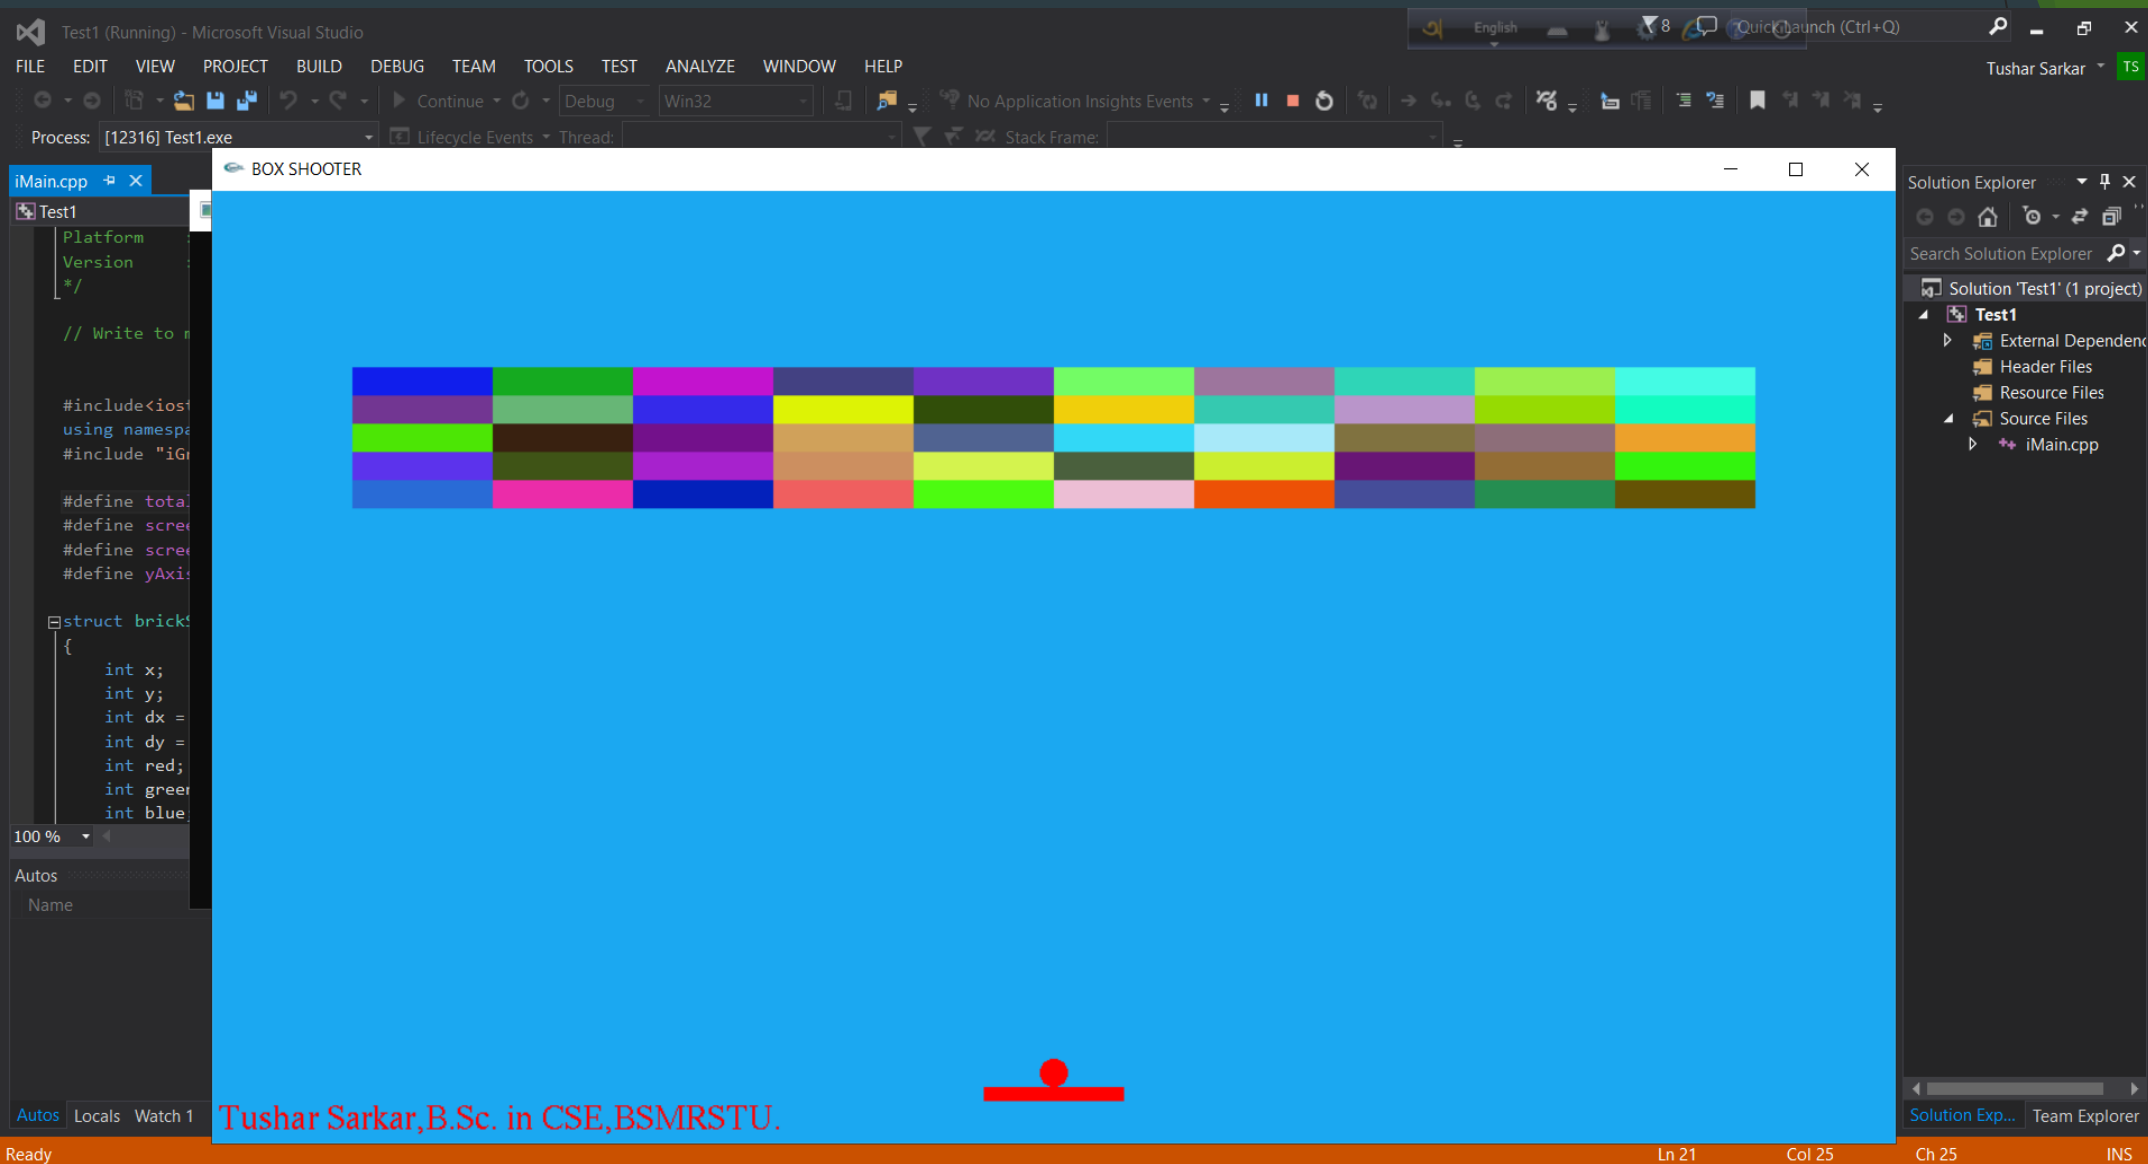

The Solution Explorer on the right shows the project structure:

- Solution 'Test1' (1 project)
 - Test1
 - External Dependencies
 - Header Files
 - Resource Files
 - Source Files
 - iMain.cpp

The Output window at the bottom shows 'Show output from: Debug'.

At the bottom of the screen, the Windows taskbar is visible with the system clock showing 12:43 AM on 11/27/2020.

First Look when Program Run

While the game is going on

Test1 (Running) - Microsoft Visual Studio

FILE EDIT VIEW PROJECT

Process: [13208] Test1.exe

iMain.cpp

```
int blue;
bool show = true;
};
brickStructure brick;

int mposx, mposy;
int xBall = (int)scr;
int yBall = yAxisMar;
int Bradius = 10;

int xBoard = xBall;
int yBoard = yBall;
int dxBoard = 100;
int dyBoard = 10;

int dx = 5;
int dy = 7;

int loop = 4;
bool gameover = false;
bool success = false;

int red = 0;
int green = 0;
```

BOX SHOOTER

While the game is loss

Tushar Sarkar, B.Sc. in CSE, BSMRSTU.

When all the boxes have been eaten and success

Future Plan

- ▶ Now only those who have a programming platform and have added iGraphics can play with PC.
- ▶ It needs to be made more workable in the form of applications and there is a desire to create separate versions for mobile and PC and that will be.
- ▶ If you work harder, you will have to upload it to the Play Store separately for Windows, Linux, Mac.
- ▶ Then let's eat and in the inner workings: now there are only 50 boxes in the game and if you can eat them all, then the game is over, that is, there is only one level and the time is always the same.
- ▶ But later, when one level is finished at different times, boxes of different sizes will come and reducing the time means that the game will be different level wise.

Results & Evaluations

The functional requirements that the student developed turn, almost immediately, into a checklist that can be handed to another student. Let's look at an example. The first thing we want to do is to make sure that we can draw at least one ball and see it fall on the screen. So our testing for correct function will be:

- ▶ Can I display the ball?
- ▶ Does it move towards the bottom of the screen?
- ▶ Does it appear to speed up?
- ▶ What happens when it hits the bottom?

Conclusion

- ▶ It may seem hard to understand at first
- ▶ You're working on more complex animations you can always go back to what you learned on your ball bounce exercise to get you out of a road block you've hit.
- ▶ For instance, a walk cycle is actually prime place to use the ball bounce to help you work through it.
- ▶ The hips should move basically the exact same way that a ball bounces on the ground, of course, it's not as exaggerated but you're essentially trying to capture the exact same pattern that a ball travels.

**Thank
You
Everyone**
